

**Frailty rates - all ages**

GP data, April 2018

Rates of frailty (all ages) within whole populations. The Community Committees here are ordered from most deprived on the left to least deprived on the right.

Less deprived populations tend to have larger proportions of elderly patients, but in this chart the least deprived areas have some of the lowest rates of frailty.

**Outer West Community Committee**

The health and wellbeing of the Outer West Community Committee contains wide variation across the full range of Leeds, overall looking average for the city. Almost 10% of the population live in the most deprived fifth of Leeds\*\* with the rest distributed over the full range. Life expectancy for the Community Committee is virtually that of Leeds although male life expectancy is improving slightly quicker than Leeds and may soon overtake it.

The age structure bears some resemblance to that of Leeds overall with more very young children, and fewer young adults. GP recorded ethnicity shows the Community Committee to have larger proportions of “White background” than Leeds. Around 9% of the GP population in Leeds have no recorded ethnicity and are not included here, which needs to be taken into account. The pupil survey which has a higher rate of recording shows a similar picture with a larger than Leeds proportion of ‘White British’.

GP recorded obesity is significantly above Leeds but mid ranking in the city among other Community Committees. Common mental health issues (recorded by GPs) are the highest in the city with very little variation within the area. Smoking and diabetes are significantly below Leeds, but very close to it. One MSOA – ‘Farnley’ has the third highest smoking rate in the whole city. GP recorded severe mental health, and COPD both show a high rate also in ‘Farnley’.

The alcohol dependency test shows an older population than Leeds with the usual higher counts for males, except for the younger age bands which have much smaller rates than Leeds overall. Alcohol specific admissions are distributed widely at small area level but average for the INT, of note again is the ‘Farnley’ MSOA which is very high within Leeds for men, women and overall.

Mortality rates for under 75s are very close to the Leeds average and following it closely. ‘Farnley’ MSOA again has the highest rates in this Community Committee.

The **Map** shows this Community Committee as a black outline. Health data is available at MSOA level and must be aggregated to best-fit the committee boundary. The MSOAs used in this report are shaded orange.

\* **Deprived Leeds:** areas of Leeds within the 10% most deprived in England, using the Index of Multiple Deprivation. \*\***Most deprived fifth of Leeds** - Leeds split into five areas from most to least deprived. **Ordnance Survey** PSMA Data, Licence Number 100050507, (c) Crown Copyright 2011, All rights reserved. **GP data** courtesy of Leeds GPs, only includes Leeds registered patients who are resident in the city. **Admissions data** Copyright © 2016, re-used with the permission of the Health and Social Care Information Centre (HSCIC) / NHS Digital.
